ABSTRACT

Please replace the abstract that appears on page 20 of the specification with the following revised abstract which is submitted on a separate sheet.

ABSTRACT

A reliable method for measuring a fill level [[(7)]] of a fill substance [[(1)]] in a container [[(3)]] using a fill level measuring device [[(5)]] working according to the travel-time principle, wherein, periodically, transmission signals [[(S)] are sent in the direction of the fill substance [[(1)]], their echo signals [[(E)]] are registered and converted into an echo function [[(A(t))]], at least one echo characteristic of the echo function [[(A(t))]] is determined and, on the basis of the echo characteristics of at least one preceding measurement, a prediction [[(P)]] is derived for the echo characteristics to be expected in the case of the current measurement, the echo characteristics of the current measurement are determined taking into consideration the prediction [[(P)]], and, on the basis of the echo characteristics, the current fill level [[(7)]] is determined.
